

****ZOSONEIR International Standard v1.0**

Chapter 1 — Scope (適用範圍)

《完全正式版》**

1. Scope

The ZOSONEIR International Standard v1.0 establishes a conceptual governance and ethical framework for emerging civilizations in the age of advanced artificial intelligence, high-density data ecosystems, cross-cultural integration, and increasing global interdependence.

This document does not prescribe technical specifications nor operational algorithms.

Instead, it provides a multi-layered philosophical and structural foundation designed to:

1. Define universal ethical principles applicable across diverse cultural, political, and social systems.
2. Establish a multi-tier transparency architecture (L0–L3) for human–AI co-governance.
3. Provide a foundational structure for ethical interoperability among differing civilizations.
4. Articulate institutional and societal components required to support trust, fairness, and non-discrimination.
5. Describe mechanisms for resilience across geopolitical, cultural, and ideological boundaries.
6. Provide an operational model for human-centered decision-making enhanced—but never replaced—by AI systems.
7. Support voluntary adoption and adaptation across communities, organizations, and conceptual research bodies.

Scope Characteristics

- This standard is civilizational in nature:
It addresses not only individuals or organizations, but the structural conditions that shape collective intelligence, transparency, and ethical decision-making at scale.
- This standard is non-prescriptive:
It proposes principles and frameworks, not mandates or enforceable regulations.
Adoption is voluntary and interpretation is flexible.
- This standard is culturally neutral:
It explicitly rejects discrimination based on identity, culture, religion, geography, ideology, or demographic attributes.
- This standard is designed for evolution:
Users are encouraged to extend, modify, and refine the framework to fit regional, conceptual, or future civilizational needs.

Intended Audience

This standard may be utilized by:

- Researchers in AI governance, ethics, philosophy, systems design
- Conceptual engineers, futurists, and policy theorists
- Cross-cultural organizations and think tanks
- Communities developing alternative governance structures
- Creators and analysts producing civilizational models
- Any individual seeking a transparent, fair, and human-centered framework for decision-making

Exclusions

This standard does not:

- Serve as a national legal document
- Define enforceable laws, sanctions, or political authority
- Provide executable machine-learning algorithms
- Replace institutional, governmental, or religious governance systems
- Advocate for any political ideology or cultural dominance
